

Protect Your Drinking Water

District customers play an important role in protecting the public water supply. Backflow assemblies help prevent cross-connections, ensuring that contaminants cannot enter the drinking water system.

If your property has a backflow prevention assembly, annual testing by a certified tester is required to help keep water safe and comply with state regulations.

- 💧 **Test your backflow prevention assembly annually**
- 💧 **Submit test results to Goleta Water District**
- 💧 **Repair or replace failed devices as required**

What is Cross-connection?

Cross-connections are points in the water system where non-potable water on your property could contact drinking water through backflow. Backflow occurs when water reverse-flows, potentially allowing contaminants to enter the public drinking water system.

- ◆ **Irrigation systems**
- ◆ **Swimming pools**
- ◆ **Pesticide and fertilizer sprayers**
- ◆ **Booster pumps**
- ◆ **Appliances and equipment that use water**

A properly maintained backflow prevention assembly prevents contamination and keeps our drinking water safe. **Backflow assemblies must be tested annually by a certified tester as required by state law.**

Visit www.goletawater.com/backflow for a list of certified backflow testers and additional program information, or contact the District's Cross-Connection Control Specialist at (805) 879-4642 or dvera@goletawater.com.
