

Goleta Water District has completed the initial lead service line inventory required by U.S. EPA's Lead and Copper Rule Revisions.

Through completing a historical records review and field investigations, Goleta Water District has determined it has no lead or galvanized requiring replacement service lines in its distribution system. This includes any privately-owned or customer-owned service lines.

Goleta Water District reviewed all applicable sources of information, including

- Construction and plumbing codes, permits, and existing records or other documentation which indicates the service line materials;
- Water system records, including distribution system maps and drawings, historical records on each service connection, meter installation records, historical capital improvement or master plans, and standard operating procedures;
- Inspections and records of the distribution system that indicate service line material, including inspections conducted during the course of normal operations;
- Inspections performed by the District to identify the presence of lead or galvanized service lines requiring replacement; and
- Inspections and records of Service Line material submitted by customers and validated by the District;

In addition to reviewing the above sources of information, Goleta Water District used an alternative method to develop the inventory that was approved by the State Water Resources Control Board Division of Drinking Water on a case-by-case basis.

Goleta Water District used the interpolation method. The interpolation method is used when the water utility can divide their service area into uniform groups, such as neighborhoods or tracts. Each uniform group shares multiple common characteristics, such as time period built, location, or contractor. The service line materials for each group are assumed to be similar. Water utilities physically verified a percentage of the homes in that group to interpolate or determine the service line material for the remaining homes.

Goleta Water District created interpolation groups based on year of construction and concluded that all service lines inspected were verified as non-lead with a 95 percent confidence level or higher. No lead or galvanized requiring replacement service lines were identified.

Goleta Water District continues to document service line material information obtained from normal operations, such as service line maintenance or water meter readings and will update the initial inventory accordingly.
